

The Coastal Ecosystem Rehabilitation, DPP Has Planted 160 Mangrove Trees in the Port Area

Balikpapan, 2025 — PT Dermaga Perkasapratama (DPP), the operator of Balikpapan Coal Terminal, a coal port in East Kalimantan, not only focuses on operations, but also actively preserves the surrounding environment. One of the real actions is the planting of 160 mangrove trees in the company's coastal area during 2025.

The mangrove planting was carried out with careful consideration of natural conditions, such as tides and site readiness. Although this activity is not conducted every year, it is part of DPP's strategic approach to environmental preservation based on actual field needs. DPP wants to ensure that every mangrove planting effort has a real impact, rather than serving as a symbolic gesture

Mangroves are not only picturesque but also provide numerous benefits, from preventing coastal erosion, absorbing carbon, to serving as habitats for various marine species. DPP hopes that through these efforts, the coastal ecosystem surrounding its operations will be well maintained and provide long-term benefits for both the environment and the community.

Beyond expressing environmental concern, this activity also supports DPP's target in biodiversity aspect for PROPER (Corporate Performance Rating Program in Environmental Management). Looking ahead, DPP remains committed to continuing similar initiatives that align with sustainability principles and environmental responsibility.
